SURVEY OF WEEKLY EARNINGS - AUSTRALIA, OCTOBER, 1961

This Bulletin contains a summary of the results of a statistical survey of the actual weekly earnings of adult male employees (excluding part-time and casual employees) for the last pay-period in October, 1961.

2. The survey was based on returns from a stratified random sample of private employers subject to Pay-roll Tax. It did not include government or semi-government employment. Because of insufficient data, employees in rural industry and private domestic service were excluded, as also were employees of religious, benevolent and other similar bodies exempt from Pay-roll Tax.
3. Returns were received from all of the employers approached, numbering more than 3,500. This very satisfactory response, and the care with which the majority of returns were completed, were important factors in the success of the survey.
4. The tables herein provide particulars of the weekly earnings of adult male employees (excluding part-time and casual employees) in manufacturing and non-manufacturing industries for each State (Table 1) and in the main industrial groups for Australia (Table 2). The proportion of employees in each earnings group and the proportions at various levels of earnings are also shown.
5. In Statistical Bulletin 904 of 28th February, 1961, particulars of weekly earnings were published for the last pay-period in September, 1960. These were based on a preliminary expansion of the sample for Australia as a whole. Subsequent tabulation of results for each State separately was expected to reveal a number of differences between the preliminary and final figures and these did, in fact, occur, but in the main such differences were relatively small and did not affect materially the general pattern of earnings shown by the preliminary tabulation. The revised figures for each industry group, shown in this Bulletin in Table 4, replace those previously published in Table 4 of S.B. 904.
6. It should be noted that the survey of September, 1960 was designed to provide accurate particulars only for Australia as a whole. However, in order to provide for each State a very broad indication of changes in earnings between September, 1960 and October, 1961, the proportions of employees in each earnings group have been shown for both the 1960 and 1961 surveys in Table 3. When comparing figures in this table, the foregoing comment should be borne in mind.
7. Definitions relevant to this survey are as follows: -
  - (a) "Number of Employees" refers to adult male employees on the pay-roll of the last pay-period in October, 1961 (September, 1960), and includes employees who, although under 21 years of age, were paid at the adult rate prescribed for their particular occupation. Part-time and casual employees and those absent in the defence forces were excluded. Executive, clerical and sales staff were included, as were employees working short time who would normally have been full-time employees.
  - (b) "Total Weekly Earnings" (i.e., gross earnings before taxation and other deductions) include ordinary time earnings, overtime earnings and all other payments, such as holiday and sick pay, commission, payments above the minimum rate for contract work, incentive scheme, piece-work and profit-sharing scheme payments, points system payments, attendance bonuses, etc. Annual or other periodical bonuses have been included only at the appropriate proportion for one week. For employees paid other than weekly, only the proportion of earnings equivalent to one week has been included.
8. Sample Design. The survey was based on a stratified random sample of businesses drawn from the field of all those paying Pay-roll Tax, except for those mentioned earlier as being excluded (see para 2).

Within each State, each published industry group was divided into eight size groups, using male employment as recorded on the Pay-roll Tax returns for March, 1961 as a measure of size. This measure was also used to improve the reliability of the sample estimate, using ratio estimation. This technique involved estimating the ratio of adult male employment in a particular earnings class in October, 1961, within each industry group and State, to total male employment in March, 1961 in that industry group and State. Since total male employment by industry group and State in March, 1961 was known accurately from Pay-roll Tax records, estimates of adult male employment in these earning classes in October, 1961 were obtained by applying the estimated ratios to the corresponding known totals. The estimates thus obtained were considerably more reliable than any which could have been produced had this supplementary information not been taken into account.

The businesses selected in the sample were allocated by States and by industry and size groups in such a way that the precision of the sample estimates for total manufacturing and total non-manufacturing, expressed as percentages of the estimates themselves, would be approximately the same in each State.
